1 Usage

BIB2x is to be used inside a shell and demands redirection capabilities. Results are written to stdout, thus can be redirected from there to a file or any other device.

BIB2x understands following arguments:

`-o output` – specifies the output format. **Deprecated, use templates instead.**

> following output-targets exists:
> > **html** outputs a fancy html page. (not adjustable)
> > **plaintext** a plain dump of the BIBTEX-entries, aligned by tabs.
> > **odb** dumps the ODB – especially interesting for debug purpose.

`-f filename` – specifies the BibTeX-file to be read from.

`-t filename` – specifies the template-file to be used for generating the output.

`-r CONSTRAINTS` – specifies optional constraints to be applied to the set of entries stored in the BIBTEX file to be read from. The syntax for constraints is described in the template documentation. Enclose with quotation-marks.

`-v` – sets output to verbose – will print various information to stderr.

`-V` – prints version.

`-h` – displays a short help.
